Information for Customers Operating and Maintaining Belvac Machines

ISSUE 11, VOLUME 10, DECEMBER 2007

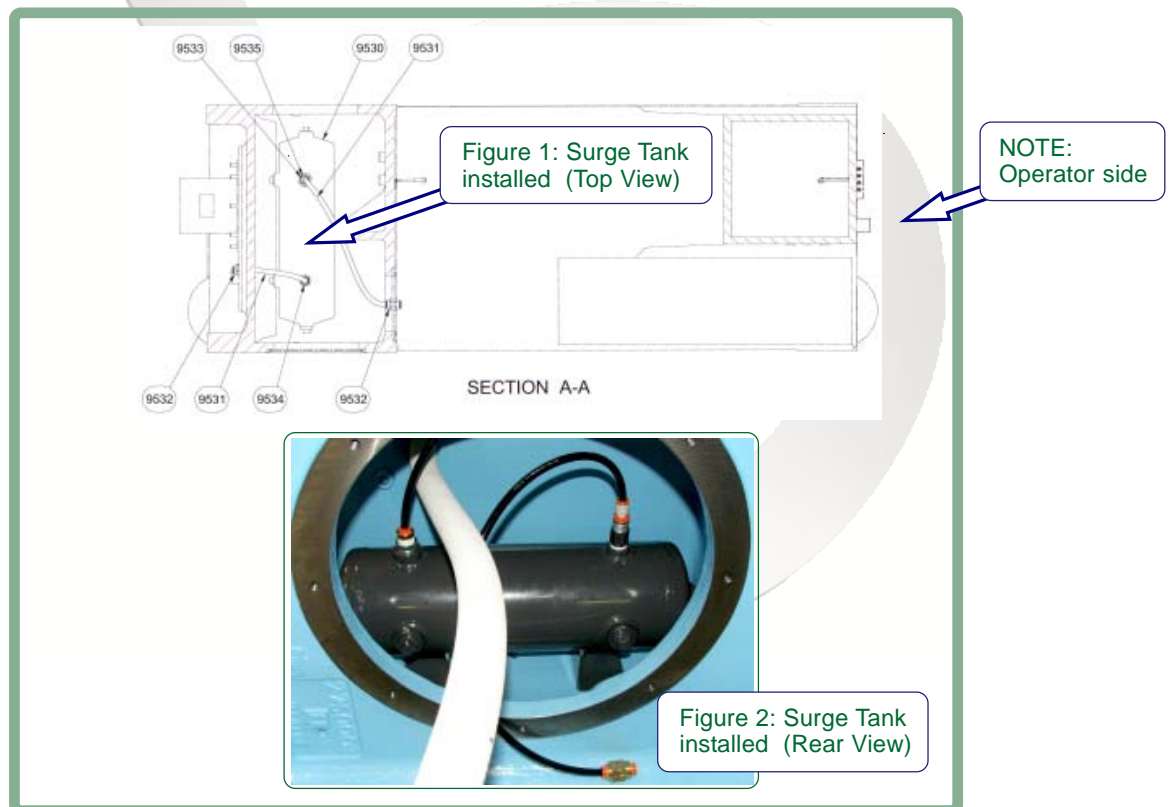

## Light Tester Surge Tank Upgrade Kit

Based on reports from our service engineers, various customer installations have requested a surge tank for their Light Tester and/or Vision reject can blow-off systems. Depending on the compressed air supply to the necking system (and other line equipment), high air demands can starve the blow-off air resources necessary for the inspection system, during multiple can ejects.

As a standard, when adding a Light Tester and/or Vision turret, Belvac recommends a 2-inch NPT independent air drop separate from the machine supply. When customers are unable to facilitate this drop, they now have the option of including our Light Tester Surge Tank Upgrade Kit # 3710530.

The surge tank kit has been adequately sized for the combination Light Tester and Vision system (if so equipped). The surge tank installs inside the vacuum chamber of our modular base unit, or to the rear of the standard fixed base Light Tester or Vision system for convenience.

The Light Tester Surge Tank Upgrade Kit # 3710530 is available as a new machine option, or as a retrofit kit for an existing machine to be installed by plant personnel.

Contact Belvac Sales or Service Representatives for additional information.
