## Advanced Air Conservation Upgrade Kit

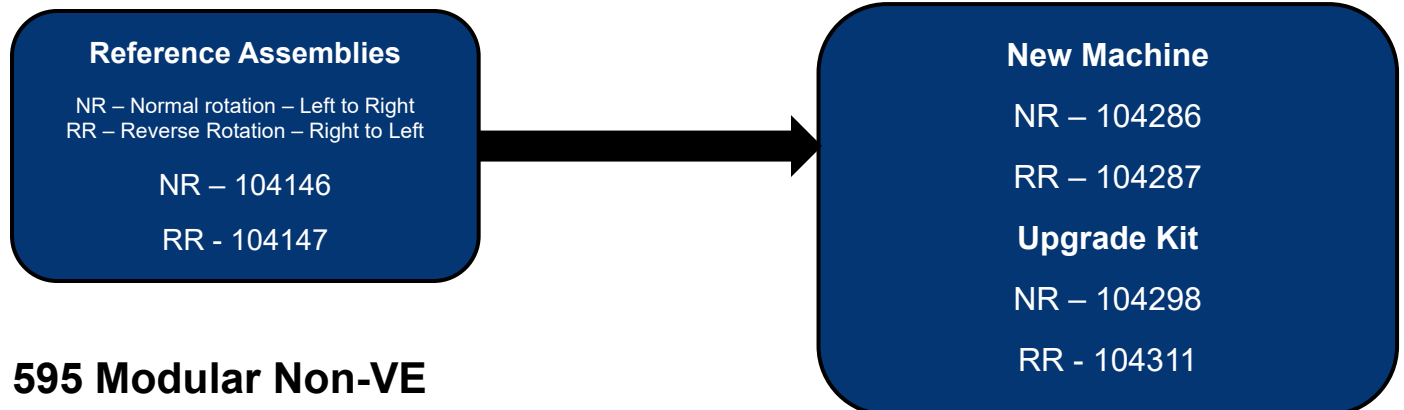

### 590 AND 595 NECKING EQUIPMENT

The Advanced Air Conservation Upgrade Kit replaces the existing Face Seal Manifold in the following machines: 590 and 595 Neckers. The new design improves the air consumption of Necker turrets (only necking tooling stage) by strategically controlling air distribution with the timing shoe and metering plate. Not applicable to Flanger, Reformer, or Light Tester. This design features a one-for-one size replacement with the previous FSM design. Operators can expect a 40% to 60% reduction in air consumption depending on machine configuration, style and more.

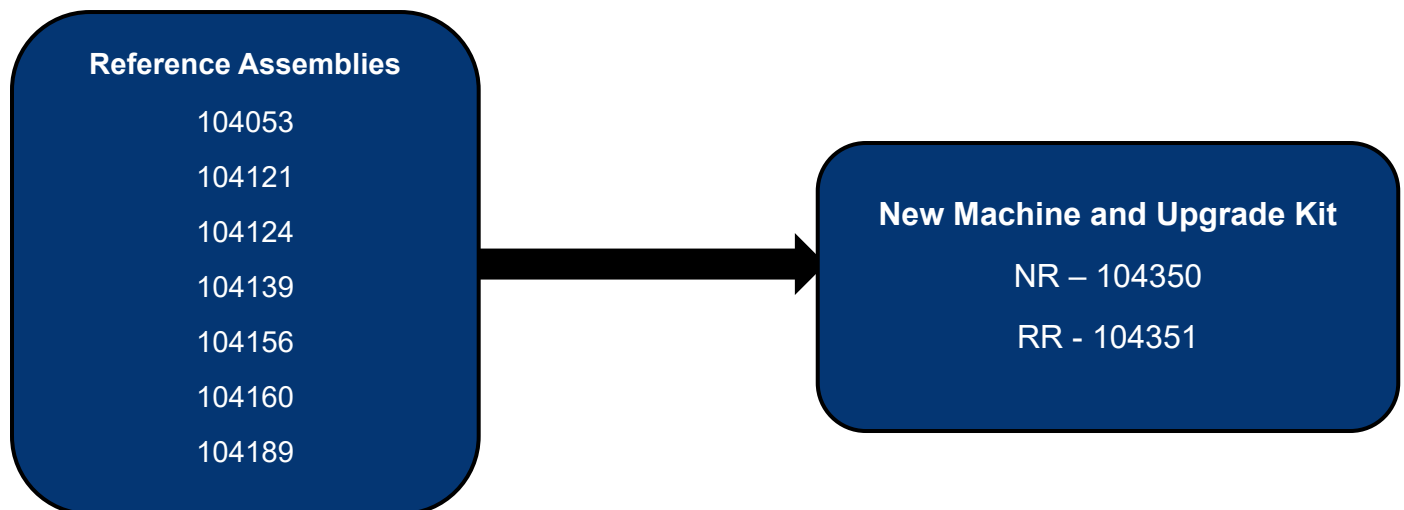

This upgrade requires specific accommodation's based on a machine's configuration. Please contact **Belvac's Service Team** ([info@belvac.com](mailto:info@belvac.com)) for more information. The Advanced Air Conservation Upgrade Kit will be phased into production throughout 2026.
